

## How to Test your JavaScript Programs from the Exercise Sheets

- 1) Search JsFiddle on the internet and click on link to reach a page which looks similar to this:

- 2) Now, you should see four different windows within your page with the headers HTML, CSS, JAVASCRIPT and RESULT. This is because JavaScript is a programming language used to code all the functionality in websites. Since HTML and CSS are the languages used to program websites, they are all combined here so it is easier to create a basic webpage. You will not need to use HTML and CSS as you are learning JavaScript only, but go checkout them out after.
- 3) When you answer the questions from the exercise sheets, you only want to code in the JAVASCRIPT section.
- 4) Now open the Console in your browser. Use cmd+option+i on Google Chrome for example. This looks like this:

## Turtle JS

- 5) So now whenever you write code in the JAVASCRIPT section using what we have taught you, you just click RUN (top left corner) on the JsFiddle page and see what the errors are on the console. (it will say more or less what the error is). If there are no errors, you can see the results of your code printing the variable you calculate or the array you sorted. Just use:

***console.log(any variable or sentence can be placed here);***

- 6) Use console.log all the time to see if you are doing the right thing!
- 7) Have Fun!
